

STRAIGHT POTASSIC FERTILIZER

Potash Derived From Molasses (PDM)

The Residue of the molasses after extraction of Ethanol is burnt in the boiler along with the other fuels resulting in the ash. This ash contains around 17-20% of Potash besides Nitrogen and Phosphorous. Thus the potash in this ash is known as Potash Derived From Molasses.

PDM is granulated to 2mm-4mm Granules with the help of some binders like Bentonite Powder, Gypsum etc. The Granulated PDM makes easy for soil application by virtue of Broadcast in the Field. It Contains 14.7% of Potash dispersible in the soil.

Potash Derived from Molasses is a Potassium Rich Fertilizer Derived from Molasses which we offer as an alternate to the existing potash Fertilizer. Potash Derived Molasses is the most economical Potash Fertilizer. This fertilizer plays a major role in both Vegetables growth phase of plants as well as in the productive phase. It improves soil reaction aeration and prevents leaching losses, it improves the water retaining capability of the soil.
